

# Application Properties Module Recap

Core concepts:

- Use application properties to set values for an application's configurable parameters
- The generalized process to create application properties is:
  - Create System Property Category
  - Create Application Properties
  - Order Application Properties
  - Create a module to set the application properties
- For most applications, application admins and system administrators can read and set application property values, but users cannot
- Use the *GlideSystem* method *gs.getProperty()* to retrieve application property values
